U.S. Patent and Trademark Office PTOL-303 (Rev. 7-05) Continuation of 5. Applicant's reply has overcome the following rejection(s): rejection of claims 6,8,10,30-35,37,39,41,43,46,48,51,53,55,58,60,62,64,67 and 69 under 35 U.S.C. 112, 2nd paragraph.

Continuation of 11. does NOT place the application in condition for allowance because: Applicants' arguments regarding the rejection of claims 1, 3, 5-11 and 30-72 under 35 U.S.C. 103(a) over Uijtewaal et al., Leone et al. and Heid et al. were considered, but were not found to be persuasive. In response to applicant's argument that it would not be obvious to one of ordinary skill in the art to combine these references, the test for obviousness is not whether the features of a secondary reference may be bodily incorporated into the structure of the primary reference; nor is it that the claimed invention must be expressly suggested in any one or all of the references. Rather, the test is what the combined teachings of the references would have suggested to those of ordinary skill in the art. See In re Keller, 642 F.2d 413, 208 USPQ 871 (CCPA 1981).

In the instant case, Uijtewaal et al. teach ribozymes containing sequence motifs 5'-GAAA-3' and 5'-CTGATGA-3', the ribozymes were introduced into plants as parts of vectors encoding them, and were detected by hybbridization with oligonucleotides containing the CTGATGA motif in the total RNA extracted from plants. The references of Leone et al. and Heid et al. are used in the rejection as they teach and suggest improved methods of detecting sequences of interest, not because these methods needed improvement, as Applicants suggest. There is a very specific motivation why of skill in the art would use the methods of Leone et al. and Heid et al. in the detection of ribozyme RNA of Uijtewaal et al., namely, that these methods allowed detection of RNA in real time, minimization of contamination, ease of handling, and potential for high-throughput analysis. As to the argument that there is no motivation in the references to use a probe that does not adhere to the target but is split off and released by the cleavage of the ribozyme, Applicants argue a limitation which is not present in the claims.
